

Automatic truck and trailer detection

Effective theft protection without false alarms

Effective fleet management assistance

Automatic truck and trailer detection

The **scomsens** truck ID constantly broadcasts its unique numerical code out.

If a **scombox** telematic unit finds itself near to the truck ID, then it transmits this truck ID code together with positioning data and other details to the receiving servers via GSM/GPRS. On the

scomview website you can then see which truck is pulling which trailer, and which trailer is being towed by which truck, and a report of this is created.

Effective theft protection without false alarms

If a trailer equipped with the **scombox** telematic unit is towed by a truck without the **scomsens** remote truck ID, this is detected by the **scombox** and either an alarm SMS or e-mail can be generated.

The advantages of Dreyer + Timm solutions:

Avoid scheduling errors, document things automatically, ten-year battery life for **scombox** truck ID, permanently active theft protection (unlike geo-fences) and no false alarms.
